

To Whom It May Concern:

Houers Cooperative is a corrugated carton manufacturer, situated in Limpopo province. Continuous steam supply and effective condensate removal are critical factors in the manufacturing process.

The Maxiflo was introduced to Houers Cooperative in 1999 and the first conventional steam traps were replaced with Maxiflo's during 2000.

Since the installation of the Maxiflo, we have eliminated cold corrugated rolls due to condensate build-up. The conventional traps failed either in a closed or open position, whilst the Maxiflo has no moving parts and does not fail at all. The Maxiflo is a very robust steam trap and no maintenance is required, except for purging at regular intervals to prevent strainer blockage.

The Maxiflo definitely improved production and although it was not measured, it is clearly visible at the condensate tank that we save on steam.

The Maxiflo added value to our operation and the quality service we received from ISP made this product even more worth the while.
